CSIRO Marine Laboratories Report No. 192

Abstract

Between 1942 and 1956, 6495 school sharks (Galeorhinus australis) and 587 gummy sharks (Mustelus antarcticus) were tagged by the CSIRO Division of Fisheries Research. Tags have been returned from this program for up to 15 years for gummy sharks and 35 years for school sharks, with recovery rates of 10.1% and 9% respectively. This has resulted in a valuable long-term record of returns, of sufficient importance to warrant publication of the raw data for future use. An analysis of part of the data on school sharks was published in 1979, since when more tags have been returned. The gummy shark data have not previously been analysed.

It is noted that, although return rates for externally tagged school sharks were low, a combination of internal and external tags resulted in a higher return rate than for internally tagged school sharks.

Introduction

During a CSIRO investigation into the biology of sharks, 6495 school sharks and 587 gummy sharks were tagged and released between 1942 and 1956. Three tagging methods were used: Petersen disks attached to the first dorsal fin; internal body cavity tags (without protruding external streamers); double-tagging, using both tags (Olsen 1953). Return rates for the various tag types given for each species in tables 1 and 2.

Table 1. School shark: tag return rates

Tag type	Number		Percentage returned
	released	recaptured	
Petersen disk	3569	76	2.1
Internal	337	50	14.8
Internal and Petersen disk		86	3.3
Internal and Petersen disk (disk lost)	2590	375	14.5
Total	6495	587	9.0

Table 2. Gummy shark: tag return rates

Tag type	Number		Percentage returned
	released	returned	
Internal	220	31	14.1
Internal and Peterson disk	367	7	1.9
Internal and Peterson disk (disk lost)		21	5.7
Total	587	59	10.1

The return rate for internally tagged school sharks was seven times higher than for sharks tagged externally with Petersen disks (Table 1), and the internal tags have been returned for up to 35 years after the tagging. This difference was noted by Grant et al. (1979), who stated that the life expectancy of Petersen disk tags was only two to three years at most. They are easily pulled out of the fin used for the tag attachment (Olsen 1953). However, it is of interest that the return rate of double-tagged sharks, with or without Petersen disks still attached, is 17.8%, while the return rate for internal tags only is 14.8% (Table 1). Thus the external marker provided by the Petersen disk increases the return rate for internally tagged sharks for the first two or three years when a larger percentage of returns are made (40.6% in the first three years (Grant et al, 1979)).

Data on school shark returns have been analysed by Olsen (1954), who reported on the movements of sharks released up to 1952 and captured up to five years after release, and Kesteven (1966) and Grant et al (1979) who used the data for growth and yield analyses. The published data have a few minor inconsistencies in the numbers released and recaptured. Gummy shark data have not been analysed, presumably because much fewer were released.

Since the last publication on school shark data, more tags have been returned, and the recovery rates have risen to 9.0% and 10.1% for, respectively, school and gummy sharks. There are thus sufficient data to warrant the publication of the raw data for future use, especially as the data on returns extend over many years.

Some of the previous publications have not made it clear that a large percentage of the tagged sharks were released in a few small areas and that releases were also made in South Australian waters (Figs 1 and 2). Of school shark releases, 67.1% were in three one-degree blocks off the Tasmanian and Victorian coasts, while 7.8% were released in South Australia. Of gummy shark releases, 47.7% were in a single one-degree block off the Tasmanian coast, while 10.1% were released in South Australia. Future analyses of the data may benefit from examining the pattern of returns in each of these areas.

Data format

Information for each year of release is listed separately, beginning with zero-return experiments. School shark data are listed first, followed by gummy shark data.

Lengths at release and capture are total lengths (cm); when necessary, conversions have been made from carcass partial lengths.

Sex was recorded for most releases; this information is included to facilitate analyses of sexual differences.

Latitude and longitude positions are recorded as 6' by 6' squares.

Where capture dates or positions are not known precisely, approximations have been given.

Column symbols

#	in 'number of males released' column: no sharks were sexed
†	in 'date recaptured' column: shark was released again after capture
()	in 'length at recapture' column: length is approximate
E, I, IE, IE*	in 'tag type' columns
E:	Petersen disks
I:	Internal cavity tag
IE:	Petersen disk and internal cavity tag
IE*	Shark return with only internal cavity tag: Petersen disk lost
